# **Operating Systems Comprehensive Exam**

Spring 2006

Student ID # \_\_\_\_\_

# 3/16/2006

You must complete all of part I (60%)

You must complete two of the three sections in part II (20% each)

In Part I, circle or select only one answer for each question, unless notified otherwise.

## Part I: You must complete all of this section.

1.	A file handle (or file	descriptor) is	a pointer into the	he		
	open file table	open file table file co			directory	file allocation table
2.	A UNIX process call	sfork() to	create a child	process a	s shown: pid = for	k();
	a) What value will b	e assigned to	pid in the pare	ent proces	ss by the call to fork(	)?
	the parent's pro	cess id	the child's pr	ocess id	zero	none of these
	b) What value will b	e assigned to	pid in the chil	d process	by the call to fork()	?
	the parent's pro-	cess id	the child's pr	ocess id	zero	none of these
3.	Which of the followi amount of time (i	ng disk sched i.e., starvation	uling algorithm can occur)?	s can, in	some cases, delay reque	ests for an indefinite
	FIFO S	STF	LOOK	SCAN	none of these	e is correct
4.	Memory compaction	can not reduc	ce fragmentation	n when _		is used.
	paging	segn	nentation		contiguous allocation	1
5.	If a system is in an un	isafe state, it i	s guaranteed that	at a deadl	ock will occur.	
	True	False				
Ma	atching: choose the	best answer	for each ques	stion fro	m the list below:	
6.		is co	mmonly used to	o impleme	ent virtual memory.	
			y	<b>r</b>	j	
7.	The working set mod	lel for paging	is based upon t	he assum	ption of	·
8.	If a page's		is set, the pa	ge must l	be written to disk before	e it is replaced.
9.		is used with th	ne base register	to detern	nine if a memory access	is out of bounds.
	<ul> <li>A. invalid bi</li> <li>C. page fault</li> <li>E. demand pag</li> <li>G. segment re</li> <li>I. locality</li> <li>L. program co</li> </ul>	t ing gister unter		B. 8 D. 7 F. 7 H. 6 K. 6	static linking limit register fragmentation deadlock dirty bit compaction	

#### Matching: choose the best answer for each question from the list below:

- 10. The term \_\_\_\_\_\_ refers to a software-generated interrupt.
- 11. \_\_\_\_\_, and \_\_\_\_\_ are two of the three conditions that must be satisfied to create a valid solution (algorithm) for the critical section problem.

12. \_\_\_\_\_ provide a programming interface to the services provided by the OS.

- 13. \_\_\_\_\_ processes can affect or be affected by the execution of another process.
- 14. When a process uses a \_\_\_\_\_\_\_\_ send to deliver a message, it must wait until the receiving process gets the message.

15. The \_\_\_\_\_\_ module gives control of the CPU to the process selected by the short-term scheduler.

- A. mutexB. job schedulerC. cooperatingD. progressE. kernel modeF. privileged instructionsG. blockingH. atomicJ. dispatcherK. system callsL. mutual exclusionM. independentN. bounded waitingO. asynchronousP. trap
- 16. Does the following pair of operations correctly implement a Semaphore?

ſ	<pre>wait(S) {</pre>	<pre>signal(S) {</pre>
	<pre>while(S &gt;= 0);</pre>	S++;
	S;	}
	}	

Yes

No

If not, briefly explain the error:

Assuming that the Semaphore code is correct (or has been corrected), briefly describe two disadvantages of this type of Semaphore:

17. Internal fragmentation can occur when using (circle all that apply):

	memory segmentation	contiguous file allocation	indexed file allocation			
	linked file allocation	contiguous memory allocation	memory paging			
18.	8. External fragmentation can occur when using (circle all that apply):					
	memory segmentation	contiguous file allocation	indexed file allocation			
	linked file allocation	contiguous memory allocation	memory paging			

19. Clearly explain the difference between deadlock prevention and deadlock avoidance.

20. Answer the following questions based on a system that uses 24-bit memory addressing, a single-level page table and 2k (i.e., 2048) byte pages:

a) what is the maximum number of memory pages for this system?

b) how many bits in the address are used for the page offset?

c) what is the size of a memory frame (in bytes)? \_\_\_\_\_

d) how many total bytes of memory are available in the system?

II. You must complete two of the following three sections. If you complete more than two sections, clearly indicate which two sections that you want graded. Otherwise, the first two sections will be graded and the third ignored.

**A.** Given the following set of processes, answer the questions below. Assume that each new process arrives after the interrupted process has been returned to the ready queue. If two processes arrive at the same time, or have the same remaining burst time, schedule them in process number order.

Process Id	<b>Burst Time</b>	Arrival Time
1	4	0
2	2	1
3	6	2
4	3	4

Fill in the following Gantt charts as specified and answer the questions associated with each part. Write the <u>process number</u> of the executing process in the cell for each time unit.

### 1) **First-Come-First-Served** (non-preemptive):

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20

Average waiting time =

Which process had the longest response time \_\_\_\_\_

2) **Shortest-job-first** (preemptive):

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20

Average waiting time =

What was the turnaround time for process 1 \_\_\_\_\_

3) **Round Robin** (time slice (quantum) is 1 time unit):

Average waiting time =

What was the turnaround time for process 3 \_\_\_\_\_

**B.** Assume that processes 1 and 2 are dispatched concurrently and that A, B, C, D, E, F, G and H represent blocks of code and that the Semaphores S1, S2 and S3 were initialized to 0;

Process 1	Process 2
A;	E ;
signal(S2);	<pre>signal(S1);</pre>
B;	F;
wait(S1);	wait(S2);
C;	G;
wait(S3)	<pre>signal(S3);</pre>
D;	н;

For the statements below, enter  $\mathbf{T}$  if the statement is always TRUE,  $\mathbf{F}$  if it is always FALSE and  $\mathbf{U}$  if an answer can not be determined from the information given.

\_\_\_\_\_ B completes before F begins. D completes before G begins. \_\_\_\_\_ C completes before H begins. \_\_\_\_\_ A completes before G begins. \_\_\_\_\_ G completes before C begins. \_\_\_\_\_ C completes before E begins. \_\_\_\_\_ F completes before D begins. \_\_\_\_\_ G completes before D begins. \_\_\_\_\_ E completes before C begins. \_\_\_\_\_ F completes before A begins.

**C.** Given the following list of page references, in execution order:

4, 2, 5, 1, 5, 2, 3, 5, 1, 4, 2, 3

Given the number of available frames shown in the table below, how many page faults will occur for each of the following page replacement algorithms? (All pages are initially empty.)

You must show your work to receive partial credit, otherwise only your answers will count.

Algorithm	# of page faults
FIFO with 4 frames	
LRU with 3 frames	
Optimal with 3 frames
