1.6 Case Study: Random Surfer

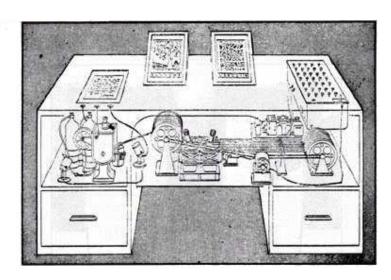

Memex

Memex. [Vannevar Bush, 1936] Theoretical hypertext computer system; pioneering concept for world wide web.

- Follow links from book or film to another.
- Tool for establishing links.

Life magazine, November 1945

Vannevar Bush

World Wide Web

World wide web. [Tim Berners-Lee, CERN 1980] Project based on hypertext for sharing and updating information among researchers.

first Web server

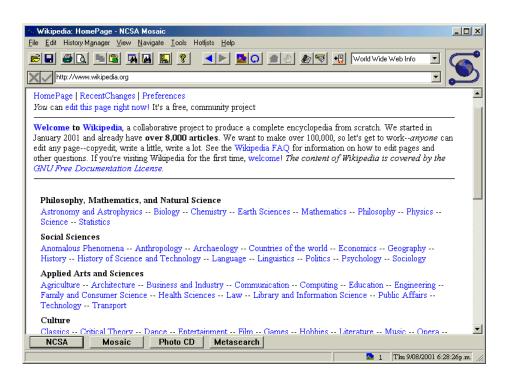

Sir Tim Berners-Lee

Web Browser

Web browser. Killer application of the 1990s.

Library of Babel

La biblioteca de Babel. [Jorge Luis Borge, 1941]

When it was proclaimed that the Library contained all books, the first impression was one of extravagant happiness... There was no personal or world problem whose eloquent solution did not exist in some hexagon.

this inordinate hope was followed by an excessive depression. The certitude that some shelf in some hexagon held precious books and that these precious books were inaccessible seemed almost intolerable.

Web Search

Web search. Killer application of the 2000s.

Web Search

Web Search

Relevance. Is the document similar to the query term? Importance. Is the document useful to a variety of users?

Search engine approaches.

- Paid advertisers.
- Manually created classification.
- Feature detection, based on title, text, anchors, ...
- "Popularity."

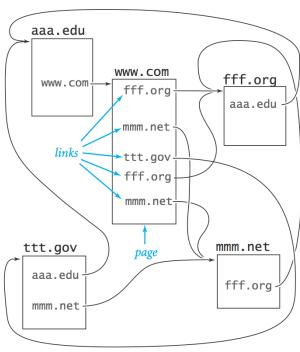

PageRank

Google's PageRank™ algorithm. [Sergey Brin and Larry Page, 1998]

Measure popularity of pages based on hyperlink structure of Web.
 Revolutionized access to world's information.

90-10 Rule

Model. Web surfer chooses next page:

- 90% of the time surfer clicks random hyperlink.
- 10% of the time surfer types a random page.

Caveat. Crude, but useful, web surfing model.

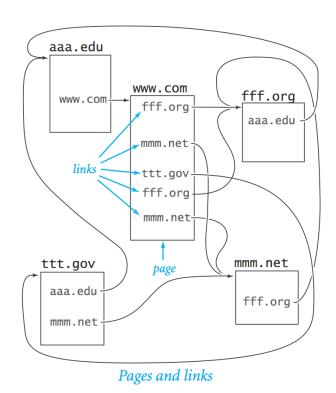

- No one chooses links with equal probability.
- No real potential to surf directly to each page on the web.
- The 90-10 breakdown is just a guess.
- It does not take the back button or bookmarks into account.
- We can only afford to work with a small sample of the web.

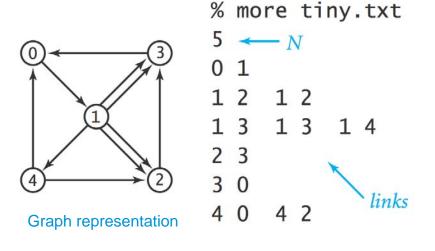

...

Web Graph Input Format

Input format.

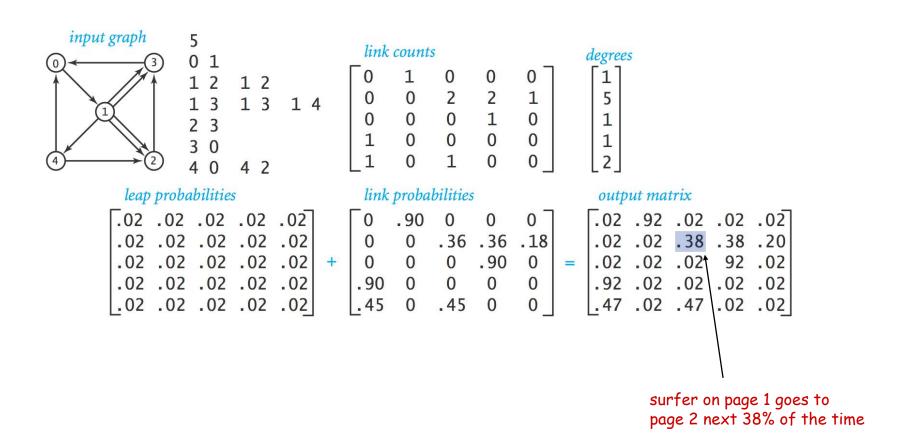

- N pages numbered 0 through N-1.
- Represent each hyperlink with a pair of integers.

Transition Matrix

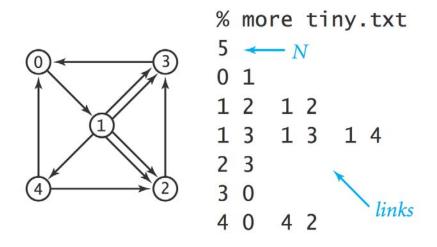

Transition matrix. p[i][j]= prob. that surfer moves from page i to j.

Web Graph to Transition Matrix

```
public class Transition {
  public static void main(String[] args) {
     int N
                    = StdIn.readInt(); // # number of pages
     int[][] counts = new int[N][N]; // # links from page i to j
     // accumulate link counts
     while (!StdIn.isEmpty()) {
        int i = StdIn.readInt();
        int j = StdIn.readInt();
        outDegree[i]++;
        counts[i][j]++;
     // print transition matrix
     StdOut.println(N + " " + N);
     for (int i = 0; i < N; i++) {</pre>
        for (int j = 0; j < N; j++) {
           double p = .90*counts[i][j]/outDegree[i] + .10/N;
           StdOut.printf("%7.5f ", p);
        StdOut.println();
```

Web Graph to Transition Matrix

```
% java Transition < tiny.txt
5 5
0.02000 0.92000 0.02000 0.02000 0.02000
0.02000 0.02000 0.38000 0.38000 0.20000
0.02000 0.02000 0.02000 0.92000 0.02000
0.92000 0.02000 0.02000 0.02000 0.02000
0.47000 0.02000 0.47000 0.02000 0.02000</pre>
```

Monte Carlo Simulation

Monte Carlo Simulation

Monte Carlo simulation.

How? see next slide

- Surfer starts on page 0.
- Repeatedly choose next page, according to transition matrix.
- Calculate how often surfer visits each page.

```
.02 .92 .02 .02 .02
.02 .02 .38 .38 .20
.02 .02 .02 92 .02
.92 .02 .02 .02 .02
.947 .02 .47 .02 .02
```

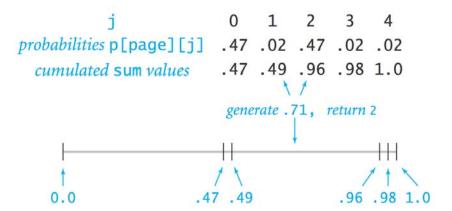

transition matrix

Random Surfer

Random move. Surfer is on page page. How to choose next page j?

- Row page of transition matrix gives probabilities.
- Compute cumulative probabilities for row page.
- Generate random number r between 0.0 and 1.0.
- ullet Choose page ullet corresponding to interval where ullet lies.

transition matrix

Random Surfer

Random move. Surfer is on page page. How to choose next page j?

- Row page of transition matrix gives probabilities.
- Compute cumulative probabilities for row page.
- Generate random number r between 0.0 and 1.0.
- Choose page j corresponding to interval where r lies.

```
// make one random move
double r = Math.random();
double sum = 0.0;
for (int j = 0; j < N; j++) {
    // find interval containing r
    sum += p[page][j];
    if (r < sum) { page = j; break; }
}</pre>
```

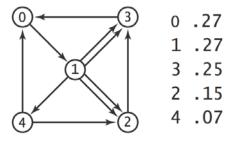

Random Surfer: Monte Carlo Simulation

```
public class RandomSurfer {
  public static void main(String[] args) {
     int N = StdIn.readInt();
                                   // number of pages
    int page = 0;
                                    // current page
    // read in transition matrix
    // simulate random surfer and count page frequencies
    int[] freq = new int[N];
     for (int t = 0; t < T; t++) {
        // make one random move
                                    see previous slide
        freq[page]++;
     // print page ranks
    for (int i = 0; i < N; i++) {
       StdOut.printf("%8.5f", (double) freq[i] / T);
     StdOut.println();
                                           page rank
```

Mathematical Context

Convergence. For the random surfer model, the fraction of time the surfer spends on each page converges to a unique distribution, independent of the starting page.

$$\left\lfloor \frac{428,671}{1,570,055}, \frac{417,205}{1,570,055}, \frac{229,519}{1,570,055}, \frac{388,162}{1,570,055}, \frac{106,498}{1,570,055} \right\rfloor$$

[&]quot;page rank"

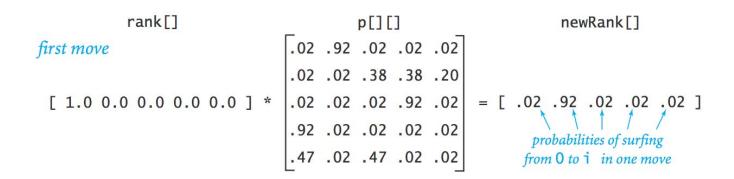

[&]quot;stationary distribution" of Markov chain

[&]quot;principal eigenvector" of transition matrix

Mixing a Markov Chain

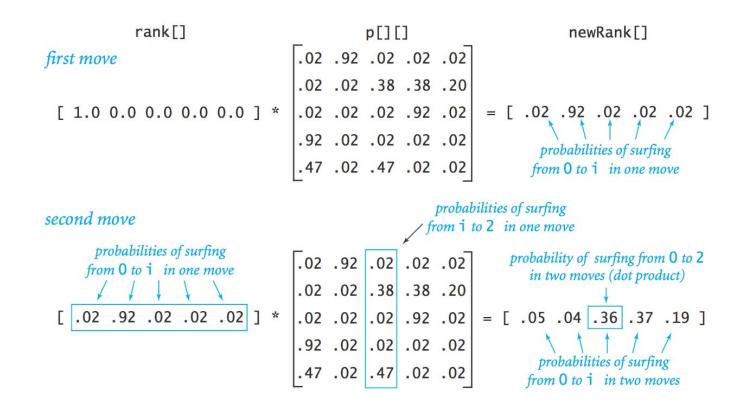

The Power Method

- Q. If the surfer starts on page 0, what is the probability that surfer ends up on page i after one step?
- A. First row of transition matrix.

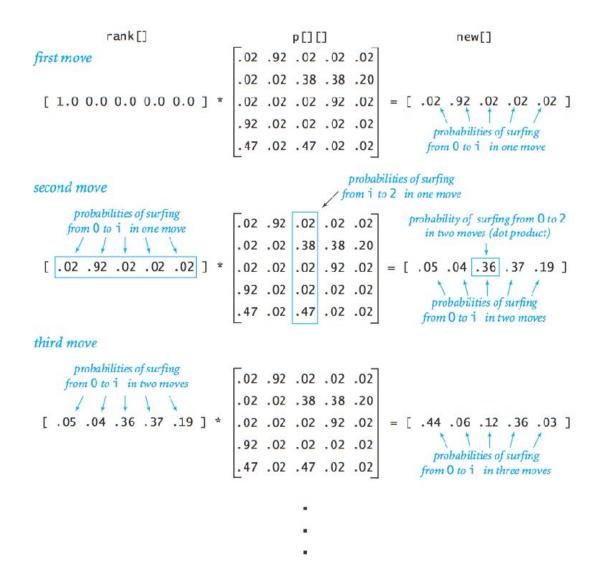

The Power Method

- Q. If the surfer starts on page 0, what is the probability that surfer ends up on page i after two steps?
- A. Matrix-vector multiplication.

The Power Method

Power method. Repeat until page ranks converge.

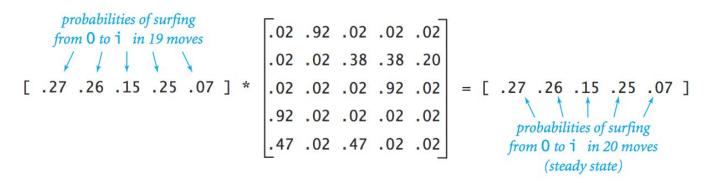

Mathematical Context

Convergence. For the random surfer model, the power method iterates converge to a unique distribution, independent of the starting page.

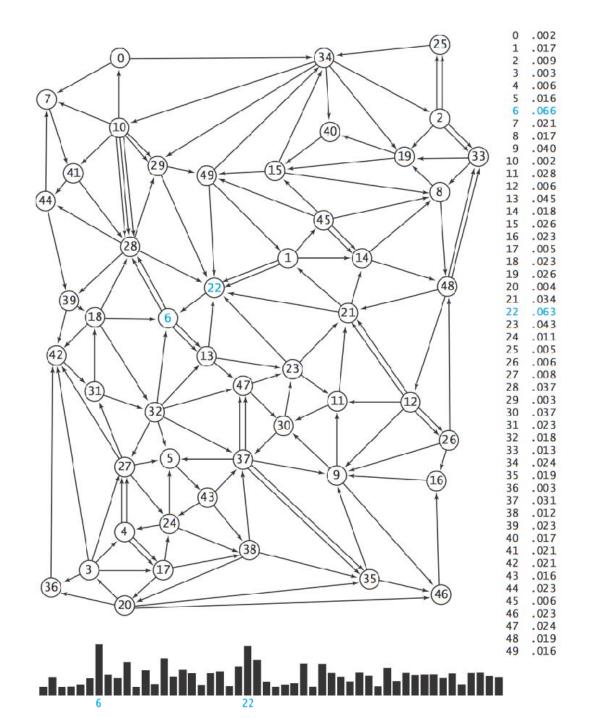

"page rank"

20th move

[&]quot;stationary distribution" of Markov chain

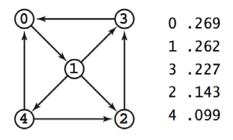

[&]quot;principal eigenvector" of transition matrix

Random Surfer: Scientific Challenges

Google's PageRank™ algorithm. [Sergey Brin and Larry Page, 1998]

- Rank importance of pages based on hyperlink structure of web, using 90-10 rule.
- Revolutionized access to world's information.

Page ranks

Scientific challenges. Cope with 4 billion-by-4 billion matrix!

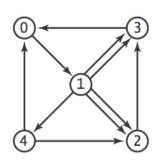

- Need data structures to enable computation.
- Need linear algebra to fully understand computation.

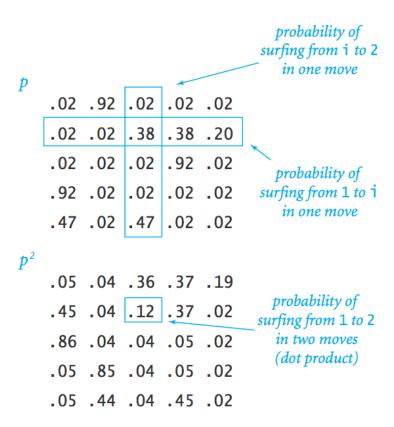

Extra Slides

Random Surfer and Matrix Multiplication

Q. What is prob that surfer moves from page i to page j in two steps?

A. $p^2 = p \times p$. [Matrix multiplication!]

Squaring a Markov chain

Random Surfer: Mathematical Context

Q. What is prob that surfer moves from page i to page j in the limit?

A.
$$\lim_{k \to \infty} P^k = P \times P \times ... \times P$$
.

Mixing theorem. Pk converges. Moreover, all rows are equal.

for our random surfer model

fraction of time surfer spends on page j is independent of starting point!

surfing from 1 to 2 in 8 steps
